

DCCN — 10-Page Master Quick Revision

High-Yield Formula Sheet, Protocol Matrices & Top 10 BIT Mesra PYQ Solutions

⚡ 10-Page Master Quick Revision — Data Communication & Computer Networks (CS24305)

Page 1: OSI 7-Layer Model vs. TCP/IP Architecture & Encapsulation	Page 2: Physical Layer: Nyquist Rate, Shannon Capacity & Manchester Encodings
Page 3: Data Link Layer: Bit Stuffing, CRC Modulo-2 Division & Hamming Code	Page 4: Sliding Window ARQs: Stop-and-Wait, Go-Back-N, Selective Repeat Math
Page 5: Medium Access Control: Pure/Slotted ALOHA, CSMA/CD Minimum Frame Size	Page 6: Network Layer: IPv4 Header Anatomy, Subnetting Masks & CIDR Lookup
Page 7: Routing Protocols: Distance Vector (Bellman-Ford) & Link State (Dijkstra)	Page 8: Transport Layer: TCP 3-Way Handshake & AIMD Congestion Control Rules
Page 9: Application Layer: DNS Hierarchy, HTTP Evolution & Email (SMTP/IMAP)	Page 10: Network Security: RSA Public-Key Cryptography Derivations & Solutions

⚡ Master Formula, Protocol & Channel Capacity Cheat Sheet

Topic / Concept	Core Mathematical Formulation / Rule	Key Exam Takeaway
Nyquist Bit Rate	$\text{BitRate}_{\max} = 2B \log_2(M)$	Applies strictly to noiseless channels with M signal levels.
Shannon Channel Capacity	$C = B \log_2(1 + \text{SNR}), \quad \text{SNR} = 10^{\frac{\text{SNR}_{\text{dB}}}{10}}$	Theoretical upper bound for noisy thermal Gaussian channels.
CSMA/CD Minimum Frame	$L_{\min} = 2 \times B \times \frac{d}{v}$	Guarantees collision detection before frame transmission ends (64 bytes in Ethernet).
Stop-and-Wait Efficiency	$\eta = \frac{1}{1 + 2a}, \quad a = \frac{T_p}{T_t} = \frac{d/v}{L/B}$	Becomes very low over high-latency satellite channels ($a \gg 1$).
GBN vs SR Window Sizes	GBN: $W_s \leq 2^m - 1, \quad \text{SR: } W_s \leq 2^{m-1}$	Prevents sequence number window overlap on lost ACKs.
RSA Decryption Key	$(d \times e) \equiv 1 \pmod{\phi(n)}, \quad \phi(n) = (p-1)(q-1)$	Security relies on computational difficulty of factoring $n = pq$.

🔥 Top 10 High-Yield BIT Mesra Exam Questions & Solutions

- Q1. A 100 km long cable has a data rate of 100 Mbps. If propagation speed is 2×10^8 m/s, find the minimum frame size for CSMA/CD. (6 Marks)
1. $T_p = \frac{d}{v} = \frac{100 \times 10^3 \text{ m}}{2 \times 10^8 \text{ m/s}} = 5 \times 10^{-4} \text{ s} = 0.5 \text{ ms}.$
2. $L_{\min} = 2 \times B \times T_p = 2 \times (100 \times 10^6 \text{ bps}) \times (5 \times 10^{-4} \text{ s}) = 100,000 \text{ bits} = 12,500 \text{ bytes}.$
